

 Enterprise Bot

Conversational AI

Build easy and automate maintenance using

 DocBrain

How did Bot Building begin?

Initially, bots were built using a 'Flow-based' technique, where the entire flow of the conversation had to be designed till the last detail. These Bots were simplistic in nature and functioned merely as FAQ bots.

As the usage of these bots grew, so did the complexities that came with it:

- Required the user to create complex flows
- Needed technical skills to edit the flows
- Regular high-effort maintenance to stay updated

The Technology evolved to meet the growing demands

To help respond to more complex queries, users began to employ 'Intent-based' chatbots.

Here, the Bots relied on a repository of pre-coded 'intents' that acted as triggers to deliver the most accurate response for requests or queries.

As the Bots became sophisticated, so did the effort that went into it.

- Required an exhaustive repository
- Users had to manually enter thousands of responses
- Repeated training and testing

It's time for another revolution in bot building

That is fuelled by a need to solve the problems of today's current bot building methods:

Increased costs

Significant resource drain

High-maintenance
to stay updated

We wanted to change this.

Bot building should be easy

So, we put together the brightest minds in the AI space
and came up **with our revolutionary solution:**

DocBrain

By Enterprise Bot

With DocBrain, you can now build your chatbot in a day and
update or maintain the knowledge base automatically without
using up your resources.

Here's how it gets easier for you

With DocBrain, all it takes to build a fully-functional chatbot is 3 simple steps.

Step 1

Enter the Website URL

Step 2

Wait just 24hrs for the AI-parser to extract relevant data and your chatbot is now ready.

Step 3

Drag and drop your backend APIs to automate critical intent-oriented actions.

Step 4

Use your website as a content repository that automatically updates conversational content.

Your intelligent virtual assistant is now aligned to your goals and demands.

Does this radically improve the way you build and manage your bots?

Yes. How? Because you no longer have to maintain multiple content repositories.

Here's why: The updates made on your website content will be automatically fetched and updated in your virtual assistant by DocBrain.

In other words, we have eliminated a problematic complexity from both your Bot building process and it's tedious maintenance.
